## Optimal Binary Search Trees

### Dynamic programming.

Operation Research.

The goal of the maximum weight independent set problem (MWIS) is to compute, for a given set of geometric objects with certain weights, a subset of disjoint (non-overlapping) objects with maximum total weight.

There is a PTAS (polynomial-time algorithm scheme) for MWIS in disk graphs, provided that a disk representation of the graph is given. The running-time for achieving approximation ratio  $1 + \epsilon$  is  $n^{O(1/\epsilon^2)}$  for a disk graph with n disks.

#### Details:

• Executed on: Qui Out 02 04:39:16 BRT 2014.

• Number of disks: 40.

• Execution time: 32865,894425 SECONDS.

• Memory required: 14680 bytes.
